VB WPF

Introduction

This setting changes the look of a window. If you are looking to create a dialog that is not a ToolWindow, pick your favorite style and then change the ResizeMode property.

None

Self explanatory, the window has no border. There is only one reason for this, you need to run a window on top of another. Windows focus logic prevents you from being able to create your own window using this setting.

SingleBorderWindow

Standard setting.

ThreeDBorderWindow

The best looking window. It's the same as SingleBorderWindow, it just has a shadow around it.

ToolWindow

Wonderful setting for dialogs that run on top of other windows.
