## Frontend programming (HTML/CSS/JavaScript)

### Introduction

A frontend programming project is a website project, it's not something that fits into a website like a layout does.

It's a game changer in that it addresses using JavaScript, which turns out to be a replacement for security driven backend websites.

Nearly all servers can provide the hosting service for a frontend website. There are three languages in the frontend programming production environment: HTML, CSS, and JavaScript.

The projects utilize SCSS for CSS preprocessing but do not use a JavaScript preprocessor. All JavaScript and SCSS files are minimized. A CSS preprocessor minifies the files, and I use a minification extension for JavaScript.

You can find all the software at <https://awwshop.wikidot.com/operations:software-visual-studio-code/>.
